Though I cannot promise my solution will be effective. If you've got \$50 to spend I'd recommend send it off to a place like [brickedmyphone.com](http://brickedmyphone.com) and have them do repair directly via EMMC. That way is a surefire fix for non-ILAPO 9008 issues.

Or if you can microsolder you could buy a Medusa Box and do it yourself. Pinouts for the h811 are available, and h815 too maybe.

i ll tell you the story of my q4 (LqH811 or VS986) however is the true name

i bay it fome some one as new Lq G4 (H811 HW:10 FCC:ZNFh811.....etc) write under the battery ....

i tried to update with LGUP to version H811 10N ...progress to 100% as finish ...but the LG dont turn up again  
(qualcomm 9008 ...)

.....

i tried this method by using toshiba 32 GB classe 10 SD card .....no succes

**👍 MOST THANKED**

So maybe I flashed the wrong images \*again\*? Goddamnit. I should have dipped right into LAF download mode and flashed the stock KDZ. I've been a fool.

Anyway, I'm including the files I used to make all this happen in case anyone finds them useful: [[download](#)]

It turns out creating the partition.xml, rawprogram0.xml, and patch0.xml is incredibly simple. Too bad I could not get Firehose to work, it kept throwing this error at me whenever I tried:

Code:

```
{ERROR: OpenPort:4197 It took 10.01600000 seconds
```

I \*was\* using a firehose 8992\_lite.mbn file from who knows where, that could be why maybe? That is one file I'm not sure how to create yet, though the code to create it is in the same repo at the ptool.py link I posted above.

I have G Flex 2, I followed your steps but it seems some partitions were mentioned in the partition.xml didn't exist in the rom files.

Try: after plugging USB cable then disconnect battery? Or just plug in with battery disconnected? I could get life out if my 9008 bricked G2 by doing that when I thought it was totally dead.

Dump plus partition listings like those posted above would be helpful. Include firmware version etc.

I wish I had a G2, I always loved this phone I just I couldn't find good one so I bought this \*\*\*\*.

anyway, Do you know how I can convert a KDZ file to IMG or BIN so I can dd it on the sdcard. it may work after all.

Look for the **LG Firmware Extractor** here on XDA, that'll separate a kdz or tot into images. Make sure to download the latest version.

Did you create your own partition.xml from the gpt file? You can also edit that file to use what whatever partitions your device had. The first ones I did by hand like that. You really don't even need to include all your partitions, just enough to jumpstart your device. Leave the filename blank in the partition.xml for any partition you wish to omit from the singleimage.bin.

Which G4 variant do you have? What is the status of your device? Just 9008 or can you enter recovery? Does it boot at all?

the model is h818p, no recovery, no download mode, not fastboot, screen off, only qualcomm 9008, not that version of firmware,  
please help

The KDZ H815 not prove that my model is h818p and do not want to be damaged, more than it already and I get are model LGUP because the dump file to use is that model, so I need the dump to h818p the process got it from [here](#)

## How can I preserve this state?

I fear it's not charging, keeps trying to boot

----- Post added at 11:49 AM ----- Previous post was at 11:46 AM -----

I got it into the recovery! No battery percent :/

----- Post added at 11:57 AM ----- Previous post was at 11:49 AM -----

She's charging! What do I do? I lost my **laptop charger** I need ADB! AAAAAKKKK 🤔

----- Post added at 12:29 PM ----- Previous post was at 11:57 AM -----

I got it booted into AICP! Is that singleimage.bin the 20o firmware? I'm so scared to flash anything!
